

## Claims

What is claimed is:

- [c1] A cable distribution box, comprising:  
an authentication device obtaining authentication information from an authentication medium; and  
an access control system operatively connected to an access administration system granting access to the cable distribution box when the authentication information is verified,  
wherein the access administration system operatively connected to the authentication device for verifying the authentication information and collecting work log data.
- [c2] The cable distribution box of claim 1, further comprising:  
a lock operatively connected to the access control system unlocking the cable distribution box when access to the cable distribution box has been granted.
- [c3] The cable distribution box of claim 1, further comprising:  
a communication device operatively connected to the access control system providing communication services between the access control system and the access administration system.
- [c4] The cable distribution box of claim 1, wherein the communication device is at least one selected from the group consisting of a communication adapter and a cable modem.

- [c5] The cable distribution box of claim 1, wherein the access administration system comprises at least one selected from the group consisting of access administration hardware, access administration software, and firmware.
- [c6] The cable distribution box of claim 1, wherein the access control system comprises at least one selected from the group consisting of access control software, access control hardware, and firmware.
- [c7] The cable distribution box of claim 1, wherein the authentication device is a card reader and the authentication medium is an access card.
- [c8] The cable distribution box of claim 7, wherein the access administration system includes functionality to disable the access card.
- [c9] The cable distribution box of claim 1, wherein the access administration system collects the authentication information.
- [c10] The cable distribution box of claim 1, wherein the access administration system generates a work log from the authentication information and the work log data.
- [c11] The cable distribution box of claim 10, wherein the access administration system includes functionality to analyze the work log to determine whether a response is required and functionality to send an alert to an appropriate entity if the response is required.
- [c12] The cable distribution box of claim 1, wherein the access administration system verifies the authentication information using a request-response authentication method.
- [c13] The cable distribution box of claim 1, wherein the access administration system verifies the authentication information using a challenge-response authentication method.

- [c14] The cable distribution box of claim 1, wherein communication between the authentication device and the access control system is encrypted.
- [c15] The cable distribution box of claim 1, wherein communication between the access administration system and the access control system is encrypted.
- [c16] The cable distribution box of claim 1, wherein the authentication device, the access administration system, and the access control system are powered using current obtained from a cable line operatively connected to the cable distribution box.
- [c17] The cable distribution box of claim 2, wherein the lock is powered using current obtained from a cable line operatively connected to the cable distribution box.
- [c18] The cable distribution box of claim 3, wherein the communication device is powered using current obtained from a cable line operatively connected to the cable distribution box.
- [c19] A cable distribution box, comprising:  
an authentication device obtaining authentication information from an authentication medium;  
a memory operatively connected to the authentication device comprising verification information and work log data; and  
an access control system operatively connected to the authentication device and the memory, using the verification information and the authentication information to determine whether to grant access to the cable distribution box.
- [c20] The cable distribution box of claim 19, further comprising:  
a lock operatively connected to the access control system for unlocking the cable distribution box when access to the cable distribution box has been granted.

- [c21] The cable distribution box of claim 19, wherein the authentication device is a card reader and the authentication medium is an access card.
- [c22] The cable distribution box of claim 19, wherein the access control system collects the authentication information.
- [c23] The cable distribution box of claim 22, wherein the access control system generates a work log from the authentication information and the work log data.
- [c24] The cable distribution box of claim 23, wherein the access control system includes functionality to analyze the work log to determine whether a response is required and functionality to send an alert to an appropriate entity if the response is required.
- [c25] The cable distribution box of claim 19, wherein the access control system verifies the authentication information using a request-response authentication method.
- [c26] The cable distribution box of claim 19, wherein the access control system verifies the authentication information using a challenge-response authentication method.
- [c27] The cable distribution box of claim 19, wherein communication between the authentication device and the access control system is encrypted.
- [c28] The cable distribution box of claim 19, wherein the authentication device, the memory, and the access control system are powered using current obtained from a cable line operatively connected to the cable distribution box.
- [c29] The cable distribution box of claim 20, wherein the lock is powered using current obtained from a cable line operatively connected to the cable distribution box.

- [c30] A method for accessing a cable distribution box, comprising:  
obtaining authentication information from an authentication medium;  
sending an access request to an access administration system, wherein the access request comprises the authentication information;  
verifying the access request;  
generating a work log associated with the access request; and  
granting access to the cable distribution box if the access request is verified.
- [c31] The method of claim 30, further comprising:  
uploading the work log to the access administration system;  
analyzing the work log to determine whether a response is required; and  
sending an alert to an appropriate entity if the response is required.
- [c32] The method of claim 30, further comprising:  
continuously monitoring the cable distribution box to determine the status.
- [c33] The method of claim 30, further comprising:  
unlocking the cable distribution box when access has been granted.
- [c34] The method of claim 30, wherein the access request is encrypted.
- [c35] The method of claim 30, wherein the access administration system comprises at least one selected from the group consisting of access administration hardware, access administration software, and firmware.
- [c36] The method of claim 30, wherein access to the cable distribution box is granted by an access control system.
- [c37] The method of claim 36, wherein the access control system comprises at least one selected from the group consisting of access control software, access control hardware, and firmware.

- [c38] The method of claim 36, wherein the access administration system, and the access control system are powered using current obtained from a cable line operatively connected to the cable distribution box.
- [c39] An apparatus for accessing a cable distribution box, comprising:  
means for obtaining authentication information from an authentication medium;  
means for sending an access request to an access administration system, wherein  
the access request comprises the authentication information;  
means for verifying the access request;  
means for generating a work log associated with the access request; and  
means for granting access to the cable distribution box if the access request is  
verified.
